

## Canine Wellness Checklist -

As dogs move into different phases of life, they experience changes that are very like aging humans. Diseases and conditions that are commonly known to affect older people also affect our canine companions: kidney, heart and liver disease, tumors, cancer, diabetes, depression, arthritis, thyroid conditions, hormonal problems, neuroses and loss of sensory perception. **By answering the following questions about your canine family member and allowing us to do annual wellness blood testing** you can assist us in detecting the onset of diseases and conditions early, *when treatment and prevention are most effective.*

<u>Risk Factors</u>	Yes	No
My dog goes out unsupervised _____		
My dog has contact with other pets _____		
There are ticks in my area _____		
There is wildlife in my area including raccoons, mice, squirrels possums and skunks _____
